ABSTRACT

JWST/MIRI is the first instrument that can directly image planets with ages similar to our own Solar System. This was recently demonstrated in the discovery of Epsilon Indi b, the first mature imaged planet. At a distance of 3.5 pc, angular separation of 4 arcsec, and with a dynamical mass of 6 Jupiter masses, Epsilon Indi b will be a key spectroscopic benchmark for models of the coldest atmospheres. However, to explore to diversity of cold planet atmospheres, we need a sample of mature gas giants like Eps Indi b at close enough distances (<10 pc) and wide enough angular separations (>1 arcsec) to be feasibly accessible to mid-infrared spectroscopic characterization. Here, we propose to image the next five most promising nearby accelerating stars with the goal of increasing the sample of cold giant planet benchmarks. By focusing on astrometric accelerations between Hipparcos and Gaia, this program is able to prioritize the stars with the highest probability for delivering planets with similar temperatures, distances, and angular separations to Eps Indi b. Planets discovered through this survey will sample the diversity of cold giant planet atmospheres, benchmark the models used for cold free-floating planets, and will enable the first ensemble tests of substellar evolutionary models at old ages through their dynamical masses.

OBSERVING DESCRIPTION

In this program, we will obtain JWST/MIRI observations of five nearby accelerating stars to search for cold giant planets. Each sequence will consist of F1056C and F1550C MIRI coronagraphic imaging of a science and reference star. We do not include multiple roll angle to maximize the efficiency of this MIRI high-contrast imaging program. Each sequence is scheduled as a non-interruptible sequence to mitigate thermal background and wavefront drift. Each sequence is also bracketed by nearby background frames. We have added constraints on the PA of each observation based on the astrometric acceleration direction to ensure that the sources of these accelerations do not fall on the diffraction spikes of the four quadrant phase mask.

Comments: Background for HIP 84478. Coordinates were generated by looking for a nearby patch of sky in 2MASS and allWISE with few bright sources using the Aladin web tool. Since this target is near the galactic center, there will likely be some contamination from background sources, which we will mitigate through the two dithers and masking as needed.
