ABSTRACT

Signs of Polycyclic Aromatic Hydrocarbons (PAHs) are everywhere in the interstellar medium (ISM). PAHs account for almost 15% of the interstellar carbon in the ISM and radiate up to 20% of the total infrared power emitted by the Milky Way and star-forming galaxies. Not only are

PAHs thermal regulators of the ISM, but they also trace star formation and the chemical enrichment of galaxies. Despite their important role, the origins of PAHs are still uncertain. Carbon-rich Wolf-Rayet (WC) binaries have recently emerged as a potential source of PAHs. JWST has since thrust these systems into the spotlight, where spectroscopic and imaging observations revealed prominent PAH emission from nested circumstellar dust shells around the colliding-wind WC binary WR 140. Further JWST imaging has revealed nested circumstellar shells around all the dusty WC binaries it has observed. However, the abundance of PAHs in the dust shells formed by the systems other than WR 140 is uncertain due to the lack of spatially resolved spectroscopic observations, which are needed to confirm WC binaries as prolific PAH producers. To address this, we request 21.8 hours with MIRI to obtain spectroscopic and imaging observations of the newly resolved dust shells from the four WC binaries: WR 125, WR 112, WR 137, and WR 48a. The proposed observations would enable a crucial test on PAH abundance from WC binaries and allow us to quantify their PAH production efficiency from the measured fraction of PAH vs. dust mass. Based on their PAH production efficiency, the key science goal of this program is to determine whether WC binaries are significant sources of PAHs in the ISM of galaxies.

OBSERVING DESCRIPTION

We propose a total of 21.8 hr of JWST observations using the MIRI MRS and the MIRI Imager with the F1500W filter on the circumstellar shells of four dust-forming WC binaries: WR 125, WR 112, WR 137, and WR 48a. Motivated by previous JWST results from WR 140, the goal of the observations is to reveal and quantify the abundance of PAHs in the dust shells of our four targets to determine whether or not WC binaries can be significant sources of PAHs.

For each target, we request two MRS pointings to capture dust shells formed by the WC binaries in addition to a dedicated sky background as recommended by the JWST User Documentation. Given that PAH features are prominent around 6-12 microns, we set our MRS exposure times based on Cycle 2 MIRI imaging of our four proposed targets at 7.7 microns. We use the latest version of the ETC (v5.0) to determine the MRS exposure time required to achieve a signal-to-noise ratio (SNR) greater than 20 at 8 microns, which is needed to perform robust PAH and dust model fitting for measure PAH and dust masses. The science exposure times for the two offset pointings of each target is listed in the table above and utilize the FASTR1 readout pattern. The exposure time for the dedicated sky background observation is determined by the longer science exposure time. For each MRS observations, we request a 4-point dither pattern optimized for an extended source. No target acquisition is requested given the extended nature of the circumstellar dust shells.

Given the partial coverage of the dust shells from the proposed MRS observations, Imaging of our four targets with the standard 4-pt dither pattern using the F1500W filter is requested to confirm the full morphology of the dust shells. We note that the dust shells from our targets will have changed by >0.2" in Cycle 5 from their initial imaging observations in 2024. We request the same exposure time (1432 s) as the Cycle 2 observations that revealed the dust shells around the four targets. The time requested for the Imager observations (including overheads) is only 20% of the total proposed observing time.

Special Requirements	Group Observations 16, 17, 18, 19, Non-interruptible

Observation

Proposal 10337, Observation 18: WR125-Bkgd

Tue Apr 21 21:00:52 GMT 2026

Diagnostic Status: Warning

Observing Template: MIRI Medium Resolution Spectroscopy

Diagnostics

(WR125-Bkgd (Obs 18)) Warning (Form): Imager Filter overlap.

(WR125-Bkgd (Obs 18)) Warning (Form): Imager Filter overlap.

(Visit 18:1) Warning (Form): Overheads are provisional until the Visit Planner has been run.

Fixed Targets

#	Name	Target Coordinates	Targ. Coord. Corrections	Miscellaneous
(16)	WR125-Bkgd	RA: 19 28 16.0902 (292.0670425d) Dec: +19 32 41.00 (19.54472d) Equinox: J2000	Parallax: 1.3189999999999998E-4" Epoch of Position: 2000	

Comments: This object was generated by the targetselector and retrieved from the SIMBAD database.

SIMBAD listed proper motion for this target. When retrieving targets with PM from SIMBAD, APT requests the coordinates be calculated with an epoch of the year 2000. Do not modify this epoch. Always review coordinates using the Target Confirmation tool, which graphically displays the PM.
Category=Calibration
Description=[Telescope/sky background]
