ABSTRACT

We propose a comprehensive public program targetting the electromagnetic counterpart to a gravitational wave source. The counterpart - a kilonova - is created by rapid neutron capture (the r-process) in the neutron-rich ejecta from the merger of two neutron stars, or a neutron star and a black hole. The one kilonova studied in detail to date confirms predictions that they are faint, red and fast-evolving. The unique combination of depth and wavelength coverage from JWST will enable the next pivotal breakthroughs in their study. We will map the bolometric luminosity to determine the quantity of heavy elements produced. Their synthesis sites will be isolated by mapping the relative strengths of blue emission (from lighter elements) and red emission (from heavy elements). Late time photometry can detect the presence of any long-lived radioisotopes from the heaviest elements. Our spectroscopic observations will go further, enabling us to decompose the various kilonova components, and search for individual elements either in the early or late phases of the KN. Finally, the deep observations will provide a unique route to determining the distance to the host galaxy, enhancing the accuracy of the gravitational wave derived Hubble constant, and will provide a high-resolution view of the merger environments. Together these observations will create significant new knowledge about the origin of the heaviest elements known in nature, including those of great value (e.g. gold) and some which are vital to life on Earth (e.g. iodine, thorium). To enhance community value, we propose a public programme and

will make reduced products available shortly after the observations.

OBSERVING DESCRIPTION

We propose a series of imaging and spectroscopic observations of a kilonova associated with a gravitational wave source. We will start obsevations within 3-5 days of the detection, triggering after a counterpart has been found. We will obtain 6 epochs of spectroscopy and 6 epochs of imaging, spaced over the weeks and months following the merger. A full description of the strategy and justification is provided in the technical description. Here we outline the observations (but not their motivation).

Spectroscopy will be taken with NIRSpec. Depending on the source brightness (and distance, since this informs predictions of the brightness) we will use either the mid-resolution grating or the prism. Spectroscopic observations will take approximately 3 hours (prism) or 4 hours (grating). Since the source is evolving in brightness we will use WATA acqusition, and a blind offset star (clearly this cannot be specified prior to the trigger time). Imaging observations will begin at approximately day 12 and will map the evolution as the source evolves over the coming months. We will use F070W, F150W, F277W and F444W to map the evolution across the full spectral energy distribution. Each epoch will obtain approximately 2000s of on source time per filter (and a total of 9023s) for the full OB. A final epoch of imaging will be required for host subtraction, and may be required for spectroscopy. Because a KN may be discovered at distances from 20-200+ Mpc and may have significant intrinsic variability we ask for some flexibility, although we have tailored our approach such that our scientific goals can be reached, even for a faint KN at a large distance. A brighter system will simply provide more diagnostic power. We note that there are some efficiency improvements over what appears in the APT, and we have taken these into account in our custom allocation request. In particular, the slew overhead of 1800s per observation is not required when our observations will be in NIRSpec and NIRCAM and will run concurrently. This saves significantly on epochs where we obtain both imaging and spectroscopy.

A full description of instrument set-up, limiting magntidues etc can be found in the technical case.

Generic Targets

#	Name	Criteria	Description
(1)	GW1	GW trigger and KN identification	

Observation

Proposal 2395, Observation 7: NIRSpec Fixed Slit

Fri Feb 03 23:01:16 GMT 2023

Diagnostic Status: Error

Observing Template: NIRSpec Fixed Slit Spectroscopy

Diagnostics

(NIRSpec Fixed Slit (Obs 7)) Error (Form): Observations using Generic targets must have an On Hold special requirement.

(NIRSpec Fixed Slit (Obs 7)) Warning (Form): Response time < 3.0 Days is significantly disruptive to the scheduling process. An additional direct scheduling overhead of 30.0 Mins will be added to the total time calculated for the observation.

(Visit 7:1) Warning (Form): Overheads are provisional until the Visit Planner has been run.

2	F150W	F444W	MEDIUM8	5	1	4	4	2061.46	63893

Special Requirements

Target Of Opportunity response time 39 Days

Observation

Proposal 2395, Observation 22: NIRCAM imaging Fri Feb 03 23:01:16 GMT 2023

Diagnostic Status: Error

Observing Template: NIRCam Imaging

Diagnostics

(NIRCAM imaging (Obs 22)) Error (Form): Observations using Generic targets must have an On Hold special requirement.

(Visit 22:1) Warning (Form): Overheads are provisional until the Visit Planner has been run.

Generic Targets

#	Name	Criteria	Description
(1)	GW1	GW trigger and KN identification	

Template

Module	Subarray
ALL	FULL

Dithers

#	Primary Dither Type	Primary Dithers	Subpixel Dither Type	Dither Size	Subpixel Positions
1	INTRAMODULE	4	STANDARD		1

Spectral Elements

#	Short Filter	Long Filter	Readout Pattern	Groups/Int	Integrations/Exp	Total Integrations	Total Dithers	Total Exposure Time	ETC Wkbk.Calc ID
1	F070W	F277W	MEDIUM8	5	1	4	4	2061.46	63893
2	F150W	F444W	MEDIUM8	5	1	4	4	2061.46	63893

Special Requirements

Target Of Opportunity response time 50 Days
