ABSTRACT

Beginning on November 4, 2025 dynamically new Oort Cloud comet C/2025 K1 (ATLAS) was observed to be outbursting. Previously planned HST context images taken as part of GO-18135 on November 8, 2025 showed multiple fragments spanning just over 5", indicating recent fragmentation of the nucleus. Such fragmentation events expose previously insulated and likely pristine materials from the ejected planetesimal's formation location, making them high priority science targets. We request 9.5 hours of NIRSpec IFU and NIRCam observations to directly measure the major and minor volatile species from a recently fragmented comet for the first time with JWST to search for heterogeneity between any new fragments, provide the best direct comparison yet to high resolution chemical models of the protosolar disk, and inform dynamic models for planetesimal scattering timescales and disk mass.

OBSERVING DESCRIPTION

We propose NIRSpec IFU and NIRCam observations of the recently fragmented comet C/2025 K1 (ATLAS). Our observing plan is as follows:

-G235/F170LP, 6 groups/integration, 1 integrations per dither, 4-POINT-DITHER configuration each visit, two visits, to capture H2O/HDO band emissions and any icy grain absorption in the coma at 3 microns.

-G395H/F170LP, 6 groups/integration, 1 integrations per dither, 4-POINT-DITHER configuration each visit, two visits, to capture CO, CO2, CH4, CH3OH, OCS, and any other trace volatiles or isotopologues that will provide insight into the formation location of C/2025 K1.

-F200W/F277W images, 1 group/integrations, 4 integrations/dither, 4 dithers. Our NIRCam observations will provide crucial context for our

NIRSpec data regarding any additional fragments just outside the IFU field, the broader dust asymmetry, as well as provide an additional probe of icy grain presence by ratioing the F277W data by the F200W.

-Each NIRSpec observation requires sequential, non-interruptible background measurements of an offset from the target.
