ABSTRACT

JWST has opened a unique window into the earliest phases of star formation where dust, ionized gas, and massive stars interact while consuming the gas reservoir. The duration of the emerging phase of star formation is among the most challenging to constrain. Analyses in metal-rich spirals find that the 3.3 micron PAH feature, a tracer of photo-dissociation regions (PDRs), remains associated with emerging young star clusters (eYSCs) for about 4 Myr, too long for large fractions of ionizing radiation to escape. At low metallicity, however, harder radiation fields and altered dust composition may change this picture. FLEET will target nine dwarf galaxies (3–8 Mpc) with vigorous star formation, spanning metallicities of 10–40% Zsun, to sample eYSCs (10^3–10^5 Msun) and their associated H II regions and PDRs at 1-5 pc resolution. From multiband NIRCam and MIRI imaging (complemented by HST observations), we will determine the timescales for clusters to emerge from their natal clouds as a function of their mass. By controlling for proximity and cluster properties (emerging stage, mass, age), we will trace PAH grain composition and its evolution, testing model predictions (inhibited growth vs. destruction) that diverge at the probed metallicity range. We will calibrate the PAH and 21 micron emission as unobscured tracers of star formation. The results of the FLEET program will establish whether cluster emergence is sufficiently short (<<4 Myr) to allow ionizing photon escape, and provide a benchmark for studies of distant dwarf galaxies and simulations of emission and dust content in low-metallicity molecular clouds across a broad range of eYSC properties.

OBSERVING DESCRIPTION

The NIRCam and MIRI coverage maximize the overlap with HST ancillary data and when available match the already available JWST observation footprints. Small coverage 2.3’x2.3' is reached with NIRCam/MODULE B/INTRAMODULEX with 4 primary and 2 small dithers to improve PSF sampling. The same area is matched with 2 MIRI pointing using 4-point cycling. The large coverage 2.3’x4.2' is reached with 2 NIRCam/MODULE B/INTRAMODULEX and (3 to 4) MIRI pointings (depending on orientation). If NIRCam observations are taken then MIRI background are done in parallel. Filter selection includes F115W, F150W, F200W, F300M, F187N, F335M, F770W, F1130W, F360M, F444W, F1000W, F2100W. Exposures are acquired with BRIGHT2/NGROUP4 up to 10 or SHALLOW4/NGROUP7 up to 10.

Fixed Targets
