ABSTRACT

A longstanding question about the SN contribution to the Universal dust budget remains ambiguous. The Spitzer Warm Mission spent over a decade building an impressive sample of dusty SNe at 3.6/4.5 micron, but these wavelengths were limited to only the warmest dust and put little constraint on the total dust yields. Only JWST offers the necessary sensitivity and wavelength coverage to characterize the expected cooler dust, particularly at late-times when the IR emission is quite faint. Two recent JWST papers on SNe 2004et and 2005ip have already revealed surprisingly large cold dust reservoirs, reigniting efforts to investigate dust formation trends in SNe. Several recent JWST proposals targeted a select, small number of SNe with this scientific goal in mind, but these programs all have multiple limitations. They are unpredictable in the sense that without recent mid-IR imaging, there is little guarantee that any single event will still be bright. They are also limited in scope, particularly when it comes to sample size and diversity in both supernova age and subclass. A Cycle 2 program (PID 3921) showed the possibility of using the Survey Mode to obtain a uniform MIRI imaging data set of a larger, more diverse sample of SNe. That program was successful, but still only a pathfinder, yielding twelve new observations with eight detections. Here we propose a larger Survey to build on that program with a minimum of 30 new observations (assuming 30% of our targets are observed). The results will enable a variety of new science and lay the foundation for important follow-up in future cycles. The data will be made public immediately to ensure it benefits the entire SN community.

OBSERVING DESCRIPTION

SURVEY program.

This proposal will image 90 (~149 hours) nearby SNe IIP, IIn, and other potentially dusty SNe with MIRI Imager. Each observation will consist of F770W, F1000W, F1500W, F2100W.
