

# 5627 - Dust and Molecular Gas in Galactic Winds and Fountains: A JWST Survey of Nearby Highly Inclined Starburst and Active Disk Galaxies

Cycle: 3, Proposal Category: GO

## INVESTIGATORS

| <i>Name</i>                        | <i>Institution</i>                          |
|------------------------------------|---------------------------------------------|
| <b>Prof. Sylvain Veilleux (PI)</b> | <b>University of Maryland</b>               |
| Prof. Joss Bland-Hawthorn (CoI)    | University of Sydney                        |
| Prof. Alberto Bolatto (CoI)        | University of Maryland                      |
| Prof. Gerald Cecil (CoI)           | University of North Carolina at Chapel Hill |
| Dr. Edmund Hodges-Kluck (CoI)      | NASA Goddard Space Flight Center            |
| Dr. Marcio Melendez (CoI)          | Space Telescope Science Institute           |
| Prof. David Rupke (CoI)            | Rhodes College                              |

## OBSERVATIONS

## ABSTRACT

The amount of dust outside of galaxies, inferred from reddened background sources, is comparable to that within galaxies. The recent discoveries of dusty winds driven by stellar and SMBH processes that extend on 100-kpc scales suggest that winds are one source, and possibly the main source, of the enriched circumgalactic medium (CGM), although the processes by which the dust is launched, entrained, and possibly altered in these winds remain uncertain. This is due to the fact that the angular resolution (2") of present-day observations is insufficient to extract the dust signal at the base of the wind against the bright galaxy, and allow to pinpoint where the dust lies relative to the cool, warm, and hot gas phases of the winds. We propose to map, for the first time on sub-arcsec scale (<10-100 pc), the warm dust and H<sub>2</sub> in 10 nearby highly inclined disk galaxies with well-known galactic winds or fountains, spanning a range in stellar masses (metallicity), energy sources (stellar or AGN), and dust erosion processes (shocks, stellar or AGN photoionization). The PAH 3.3, 7.7, 11.3, H<sub>2</sub> 17.03, and adjacent continuum emission will be compared with existing sub-arcsec maps and velocity fields of the ionized gas to determine the mechanisms by which the dust is launched and carried into the halos of these

## JWST Proposal 5627 (Created: Thursday, March 6, 2025, 5:00:27PM Eastern Standard Time) - Overview

galaxies, and whether dust grains and warm H<sub>2</sub> molecules evolve as the wind carries them to form the CGM. The <10-100 pc resolution is critical since the processes that can alter the dust and clouds in which it resides operate on such scales. The results will inform future modeling and HST/UV observations. The proprietary period is shortened given the legacy value of the data.

### **OBSERVING DESCRIPTION**

We will image each galaxy, except M82, NGC 253, and NGC 891 (see below), using MIRI and NIRCам with the following settings:

-Deep MIRI 2 x 1 mosaic without PA constraints centered on the nucleus (easy to schedule)

FULL array

4-point extended source dither pattern

Readout mode: FASTR1

Filters F560W, F770W, F1130W, F1500W, and F1800W

(sequentially, in order of increasing wavelength to avoid persistence)

F560W: 70 groups and 1 integrations per dither position

F770W: 6 groups and 5 integrations per dither position

F1130W: 15 groups and 2 integrations per dither position

F1500W: 16 groups and 3 integrations per dither position

F1800W: 8 groups and 5 integrations per dither position

No off-source background images (except for M82 and NGC 253; see below)

-Deep NIRCам 1 x 1 mosaic without PA constraints centered on the nucleus (easy to schedule)

Module B only

FULL array

Primary dither = INTERMODULEX, 2 dither position, STANDARD subpixel dither, 2 subpixel positions

Readout mode: MEDIUM8

Filters F335M (long) and F187N or F182M (short) simultaneously

4 groups and 1 integrations per dither position

No off-source background images

## JWST Proposal 5627 (Created: Thursday, March 6, 2025, 5:00:27PM Eastern Standard Time) - Overview

F182M instead of F187N is selected to fully capture the redshifted Pa-alpha in the four galaxies and their outflows and rotating galactic disks with redshifts  $z > \sim 0.005$  (NGC 1482, NGC 4388, NGC 4666, and NGC 5775), at the expense of additional contamination from the underlying continuum.

-To avoid saturation issues: MIRI snapshots of the central region without PA constraints (easy to schedule)

SUB128 subarray

4-point extended source dither pattern

Readout mode: FASTR1

Filters F560W, F770W, F1130W, F1500W, and F1800W: 5 group and 1 integration per dither position (sequentially, in order of increasing wavelength to avoid persistence)

-To avoid saturation issues: NIRCам images of the central region without PA constraints (easy to schedule)

Module B only

SUB640 subarray

Primary dither = INTERMODULEBOX, 2 dither position, STANDARD subpixel dither, 2 subpixel positions

Readout mode: RAPID

Filters F335M (long) and F187N or F182M (short) simultaneously

4 groups and 1 integrations per dither position

No off-source background images

Here and again, F182M instead of F187N is selected to fully capture the redshifted Pa-alpha in the four galaxies and their outflows + rotating galactic disks with redshifts  $z > \sim 0.005$  (NGC 1482, NGC 4388, NGC 4666, and NGC 5775), at the expense of additional contamination from the underlying continuum.

For M82, NGC 253, and NGC 891, we use the exact same settings but avoid duplication with existing or planned observations. M82 and NGC 253 are observed only with MIRI F1500W and F1800W, while NGC 891 is only observed with MIRI F1130W, F1500W, and F1800W and NIRCам F335W and F187N. For M82 and NGC 253, we also obtain off-source background MIRI images since their winds completely fill the MIRI FOV. These background images use the same settings as the science images except for the use of the 2-point extended source dither pattern to reduce overheads.
