ABSTRACT

Silicate clouds are a dominant opacity source for ultracool dwarfs and giant planets. From hot Jupiters to directly imaged exoplanets to solar system gas giants, it is clear that understanding the types of silicate clouds present is a key to understanding atmospheres as a whole. In this JWST proposal we will use isolated substellar mass objects to create a silicate spectral reference library that can greatly advance our understanding of ultracool dwarf atmospheres while at the same time provide a much needed reference for the community. Using a carefully curated selection of 25 new MIRI MRS observations and 10 from the archive, we will establish a uniform collection of spectra that cover the entirety of the primary silicate absorption feature at a resolution where we can differentiate between various cloud species speculated to be present. With this legacy JWST product we will visualize the diversity of cloud composition (e.g. enstatite, forsterite, quartz), crystallinity (e.g. amorphous vs crystalline), and particle size as well as observed strength of feature and modeled location in the atmosphere for ultracool objects. Our sample consists of 35 sources split into seven spectral subtype bins (proxy for Teff) containing two young sources (< 120 Myr), two field age sources (3 - 5 Gyr) and one calibrator old object (> 10 Gyr where no feature has been detected) and allows us to fully characterize how Teff and age correlate with cloud properties.

OBSERVING DESCRIPTION

We propose to use MIRI MRS to obtain mid-infrared intermediate-resolution spectra of 25 L-type brown dwarfs to develop a silicate absorption feature reference library which will also include an additional 10 sources from the archive. Our proposed targets have WISE W3 magnitudes between 9.3 and 12.8 mag. We will use MIRI MRS with all three grating settings, FULL subarray, SLOWR1 readout pattern, 10-83 groups per integration, one-to-two integrations per exposure, and four dither positions to obtain 5-18 micron R~2000-3700 spectra with SNR>50 at 13 microns. For target

acquisition, we will use the F1000W filter, the corresponding acquisition mode for MRS, a FULL subarray, a FAST readout pattern, and four groups, which leads to $\text{SNR} > 250$ for all targets. There are no special requirements for these observations.

Proposal 11448 - Targets - A Silicate Feature Reference Library for Brown dwarfs and Gas Giant Planets
