ABSTRACT

Deep surveys of star-forming regions have uncovered a population of free-floating planetary-mass objects (PMOs) with masses comparable to giant exoplanets. As exoplanet analogues, PMOs offer a unique opportunity to probe planetary atmospheres and cloud physics without the glare of a host star. However, their atmospheric properties and disk chemistry remain largely unexplored — key missing links in our understanding of planetary system formation at the lowest masses. Here we propose to conduct a spectroscopic survey of 15 young PMOs in the Taurus and Cha-I regions with NIRSpec/PRISM and MIRI/LRS. Our survey will complete the census of planetary mass members in both star forming regions and nearly triple the sample of very young PMOs with complete characterisation. With the 0.6-13 micron spectra we will be able to (1) test atmospheric models at temperatures of warm and hot Jupiters, (2) robustly determine the occurrence rate of disks in the planetary mass domain, and (3) place the first constraints on silicate cloud formation in the atmospheres of young PMOs. Together with existing JWST data, the resulting dataset will form the first

homogeneous library of PMO spectra, establishing critical benchmarks for future studies on these objects.

OBSERVING DESCRIPTION

We plan to obtain the low-resolution spectra of 15 young planetary mass objects, all with estimated masses of 5-10 M_{Jup} and ages of 1-2 Myr, in the Taurus and Cha-I regions. The observations will be carried out with NIRSpec in PRISM mode and with MIRI in LRS mode covering the wavelength range of 0.6-13 micron. For all the targets we can achieve a SNR>50 with NIRSpec across the complete wavelength range with an on-source exposure time of ~10 min and a standard instrument set-up. For the observations with MIRI, an on-source exposure time of ~1hr 15min produces a SNR above 100 up to 10 micron and a SNR>20 between 10-12 micron, which is sufficient to quantify the silicate feature around 10 micron. Altogether for the 15 targets we need ~21 hours of science time and since many of the targets are in the same region this significantly reduces the time to cover the overheads.
