ABSTRACT

In cycle 2, JWST/MIRI observed 56 nearby white dwarfs. Of these publicly available observations, we have identified 14 directly imaged candidates around 11 white dwarf hosts whose shape and color are consistent with $\sim 1\text{--}10$ MJup companions. We propose single-band MIRI F1500W imaging to confirm these candidates by searching for common proper motion. While background dusty galaxies remain a non-negligible contaminant, only a second epoch can determine their true nature. If confirmed, these objects would form the first statistically meaningful sample of moderately separated giant planets around white dwarfs and would provide prime targets for atmospheric characterization and benchmarks for cooling/evolution models in the cold, old regime. If the candidates prove to be background sources, the resulting upper limits will significantly tighten occurrence constraints and challenge current assumptions about post-main-sequence planetary survival.

OBSERVING DESCRIPTION

For each of our 11 targets, we proposing using MIRI imaging in F1500W. Images will use the consist of the FASTR1 pattern and the default four dithers with either 20 (4 targets), 40 (4 targets), or 60 (3 targets) groups per integration.

			Equinox: J2000			Parallax: 0.0421976"					
						Epoch of Position: 2000					
Comments: This object was generated by the targetselector and retrieved from the SIMBAD database.											
SIMBAD listed proper motion for this target. When retrieving targets with PM from SIMBAD, APT requests the coordinates be calculated with an epoch of the year 2000. Do not modify this epoch. Always review coordinates using the Target Confirmation tool, which graphically displays the PM.											
Category=Star											
Description=[Exoplanets, White dwarfs]
