ABSTRACT

We propose to leverage the unprecedented power of JWST/NIRSpec in IFU mode to take a decisive leap towards an unbiased census of QSO activity during the Epoch of Reionization. This survey program draws from all the 343 QSOs known at $5.7 < z < 7.0$, without any additional selection bias. The data will deliver simultaneous spectral coverage of the key emission lines [NII], H α , [OIII] and H β arising from the central QSO and its close (<15pkpc) environment. Assuming a completion rate of 5-10%, this sample will double to triple the number of high- z QSOs observed with the

NIRSpec IFU. This survey will provide a statistical sample of high- z QSOs enabling a variety of investigations into early black hole and host galaxy evolution. Key science goals include:

- (i) measurement of precise black hole masses and accretion rates from Balmer lines;
- (ii) determination of the incidence of [OIII] outflows;
- (iii) measurement of masses and physical properties of the QSO host galaxies and any close companions;
- (iv) derivation of physical constraints on the cool gas reservoirs in the circumgalactic medium.

This dataset will open the exciting prospect of providing a statistical view of the complex link between hierarchical structure formation, the stellar mass growth in galaxies, and the QSO activity at the dawn of the Universe, when current models of massive galaxy formation can be better constrained.

OBSERVING DESCRIPTION

Survey program

NIRSpec IFU observations of $5.7 < z < 7$ QSOs.

Total sample 343 QSOs, covering the entire extragalactic sky.

Minimum completion: 1 target

Ideal completion: 5-10% (16-35 targets)

Example Observation

NIRSpec IFU observation with G395H/F290LP.

The target is observed with 9 groups, 1 integration in a 4-points small cycling dither pattern.

NRSIRS2 has been selected for a better identification and removal of cosmic ray glitches.

Integration on source: 2,600s

Total time per target: 110min

Data Volume: 1,055Mb
