ABSTRACT

We propose JWST IFU spectroscopy (NIRSpec + MIRI) of NGC 4258 to quantify how AGN-driven shocks deposit energy and momentum into a clumpy disk at parsec-scale resolution. By mapping the full H₂ rotational and vibrational ladders alongside [Fe II] fluxes and kinematics, we will distinguish C-type shocks that compress molecular gas from J-type shocks that dissociate it and release iron from dust grains. Three representative pointings—sampling a PAH-suppressed radio peak, a stratified near-nuclear zone, and a shock-brightened outer arc—provide critical tests of wind–jet coupling and establish diagnostics applicable to radio-quiet AGN where extended radio emission may trace shocks rather than jets.

OBSERVING DESCRIPTION

We request JWST IFU spectroscopy with NIRSpec and MIRI to study shocks in three representative regions of the anomalous arms of NGC 4258. The selected pointings are (i) a bright radio peak with suppressed PAH emission, (ii) a near-nuclear zone showing stratified [Fe II]/H₂/PAH/Br alpha emission, and (iii) a shock-brightened outer arc coincident with strong [Fe II] and H₂ emission. These fields isolate distinct feedback regimes within the disk and are designed to test how AGN-driven winds and compact jet-like structures deposit energy and momentum into the interstellar medium.

At each pointing, NIRSpec IFU observations will use the G140H/F100LP, G235H/F170LP, and G395H/F290LP gratings to provide continuous coverage from 1.6–5.3 microns. This range captures [Fe II] 1.64 micron and the full set of vibrational H₂ transitions used to characterize shock excitation. MIRI MRS observations will cover 5–17 microns, tracing the H₂ rotational ladder (S(1)–S(8)) and [Fe II] 5.34 micron. Together, these modes provide contiguous spectral coverage and the resolution ($R \sim 2500\text{--}2700$) needed to measure fluxes and kinematics of both molecular and ionized gas in the same spaxels. Each pointing will include a nearby blank-sky field for background subtraction and short NIRSpec MSA “leak cal” exposures to correct for host galaxy overlap. No additional special requirements are requested beyond standard IFU operations.

Proposal 10815 - Targets - Following the Shocks: JWST IFU Spectroscopy of NGC 4258's Radio Arcs
