ABSTRACT

Cool, and therefore old, white dwarfs are commonplace in the local stellar volume, and they play a pivotal role in many areas of astrophysics, including star formation history and planetary composition. However, precise modelling of their high-density atmospheres remains the most significant challenge preventing the calculation of accurate age and mass distributions. With readily available space-based and flux-calibrated HST STIS UV spectra and ground-based optical spectra plus Gaia spectrophotometry for 34 white dwarfs within 13 pc of the Sun that are observable with JWST, we propose to obtain infrared spectroscopy from NIRSpec and MIRI LRS as the final set of observations that will constrain white dwarf atmosphere models and exploit the full scientific potential of cool white dwarfs. This volume-complete sample is representative of the local white dwarf population. Observations of the coolest targets (below 6000 K) will dictate the direction of future white dwarf modelling efforts, and lead to improvements in collision-induced absorption opacity calculations. Close, unreddened, IR-bright white dwarfs with accurately modelled atmospheres (above 6000 K), will provide much-needed precise spectral standards for current and future IR facilities. Additionally, these nearby white dwarfs will offer the best opportunity yet for a direct detection of a Jupiter-mass planet orbiting a white dwarf.

OBSERVING DESCRIPTION

We will observe all isolated white dwarfs within 13 pc of the Sun that are observable with JWST. The 13 pc white dwarf sample is volume-limited and flux-calibrated near-UV (Hubble STIS) and optical spectrophotometry are already available for the full sample. We will use three NIRSpec medium-resolution gratings and MIRI LRS to obtain spectra from 1 to 14 microns. Our observations will provide $S/N > 100$ out to 10 microns, which is excellent for our science goals: to solve the current issues in atmospheric models of cool white dwarfs, provide cooler flux standards, and search for Jupiter-mass planets from an excess above the photosphere beyond 6 microns.

Proposal 10131 - Targets - White dwarfs from the ultraviolet to the infrared: atmospheric physics, flux calibration, and planet occurrence
