ABSTRACT

Understanding the formation of supermassive black holes (SMBHs) and the physics of cosmic reionization, requires discovering and characterizing SMBHs in galaxies during cosmic dawn -- the first 5% of the universe's history ($z > 7$). In early 2024 the Euclid space mission began its 6-year optical and NIR survey to map $\sim 14000 \text{deg}^2$ to unprecedented depth, a tremendous opportunity to unveil the faintest and earliest QSOs beyond the current QSO redshift frontier at $z \sim 7.5$. While Euclid promises the discovery of a few hundred $z > 7$ QSOs with AB magnitudes up to $J=24.5$ and push QSO studies up to $z \sim 10$, it only provides candidates, and timely spectroscopic confirmation is critical. Ground-based spectroscopy nearly quadrupled the number of $z > 7.3$ QSOs in the first 2700deg^2 , but it reaches its limit at $J=23$. Only JWST can efficiently confirm QSOs down to the Euclid depth and realize the promise of the Euclid mission for QSO discovery. We propose a JWST/NIRSpec Fixed Slit Prism survey to confirm faint $z > 7$ QSO candidates ($J=23-24.5$), selected from $\sim 4400 \text{deg}^2$ of the Euclid survey at high ecliptic latitude, spanning the full right ascension range. With a 20% completeness rate, our efficient 15-min exposures will robustly identify ~ 20 new faint QSOs at $z > 7$, likely including the first $z > 8$ QSOs. Extending the QSO search to the Euclid limit unlocks the previously inaccessible regime, essential to complete high- z quasar demographics and to set stringent constraints on SMBH formation. In addition, spectroscopy of the contaminants, the brightest Lyman Break Galaxies at $z > 7$ or the most distant ultracool dwarfs known, will deliver key insights into massive galaxy formation and substellar atmospheres.

OBSERVING DESCRIPTION

Survey program

NIRSpec Fixed Slit Prism observations of $z>7$ faint quasar candidates with magnitudes $J=23-24.5$.

Total time per target: 15 min.

Parent sample: 200 sources selected from the Euclid survey. By March 2026, ~ 4400 deg² will be available at high Ecliptic latitudes, ideal for a JWST survey program (see Fig 3 in the proposal).

Minimum sample: 40 to secure a sample of ~ 20 faint $z>7$ QSOs (~ 4 at $z>8$), while characterizing QSO diversity at the faint end and quantifying survey efficiency, contamination rate to improve photometric selections.

Example Observation -----

NIRSpec Fixed Slit Prism/Clear observation with the S200A2 slit.

We will use the FULL detector with the NRSIRS2RAPID readout pattern. With three spectral dithers and 20 groups per integration, resulting in an exposure time of 919 seconds.

All candidates ($J=23-24.5$ mag) can be acquired directly using the WATA mode with a CLEAR filter, reaching $S/N=30-90$ in 43 seconds.

Data Volume: 1,724Mb
