ABSTRACT

Recent MIRI observations reveal a tantalizing age trend in the chemistry of disks around the most common stars in the Galaxy - the very stars that often host sub-Neptunes now being characterized with JWST. However, current samples mostly trace $\sim 1\text{--}3$ Myr-old low-mass star-forming regions and rely on Upper Sco as the only older anchor – a complex region where age ($\sim 5\text{--}15$ Myr) and source assignments are uncertain, and the average FUV radiation field, critical for disk evolution, is an order of magnitude stronger. A breakthrough opportunity now exists thanks to Gaia, which has uncovered a striking chain of clusters formed sequentially in Corona Australis. The clusters are cleanly separated in space, velocity, and age and span the very interval where chemical evolution is expected to unfold. We propose MIRI-MRS observations of four key clusters in this chain, covering $\sim 3\text{--}13$ Myr, to build a time-resolved record of the volatile and organic inventory inside the snowline of the Galaxy’s most common planet-forming disks. This dataset will form a lasting legacy for the community, providing a benchmark for studies of disk chemistry and the atmospheres accreted by young planets. It will also enable estimates of the instantaneous pebble mass flux - a key parameter in pebble accretion models that form sub-Neptunes. Furthermore, it will yield empirical constraints on the evolution of the inner-disk gas C/O ratio, helping to distinguish between models that explain supersolar C/O ratios, including those predicting C-rich “soot” planets.

OBSERVING DESCRIPTION

We request MIRI-MRS observations of 32 disks in 4 clusters belonging to the Corona Australis chain. We will use all three grating settings to obtain complete spectral coverage from 5 to 28 micron. Exposure times are optimized to reach $\text{SNR} \geq 100$ at $17\mu\text{m}$ to ensure robust line detections of critical C- and O-bearing molecules. Each observation begins with a target acquisition to place the source at the center of the FOV field and optimize fringe correction, filter settings are adjusted as needed to avoid saturation. The standard 4-point dither is adopted as the line emission of interest is expected to be unresolved.

Proposal 10058 - Observation 38 - Follow the Chain: A Time-Resolved Legacy of Disk Volatiles and C/O Ratios around the Most Com...

Observation	Proposal 10058, Observation 38: CrA-Main												Wed May 27 16:00:14 GMT 2026
	Diagnostic Status: Warning												
	Observing Template: MIRI Medium Resolution Spectroscopy												
Diagnostics	(Visit 38:1) Warning (Form): Overheads are provisional until the Visit Planner has been run.												
Fixed Targets	#	Name	Target Coordinates				Targ. Coord. Corrections				Miscellaneous		
	(38)	Gaia-DR3-6731200770681837696	RA: 19 01 40.4194 (285.4184142d) Dec: -36 51 42.36 (-36.86177d) Equinox: J2000				Proper Motion RA: 5.785 mas/yr Proper Motion Dec: -27.989000045636203 mas/yr Parallax: 0.0055556" Epoch of Position: 2000						
	Comments: This object was generated by the targetselector and retrieved from the SIMBAD database.												
	SIMBAD listed proper motion for this target. When retrieving targets with PM from SIMBAD, APT requests the coordinates be calculated with an epoch of the year 2000. Do not modify this epoch. Always review coordinates using the Target Confirmation tool, which graphically displays the PM.												
	Category=Star Description=[Pre-main sequence stars, Protoplanetary disks] Extended=NO
