ABSTRACT

The bulk composition of a giant planet is inherently linked to the material in the disk from which it forms. Within this broader context, disks around intermediate-mass stars (1.5–3.0 Msun) are of particular importance, as exoplanet population demographics reveal that these are the most likely systems to host gas-giant exoplanets. Surprisingly, almost nothing is known about the inner disk chemistry in the peak planet-formation zone of these disks, and very few have been targeted by JWST. Observations of disks around lower-mass stars have revealed clear chemical differences and trends in the inner planet-forming reservoir across spectral types M and K, including significant variations in the C/O ratio with stellar mass. The limited observations of intermediate-mass systems so far suggest these disks are unexpectedly CO₂-rich, with low C/O ratios, implying that they may be chemically distinct from their better-studied lower-mass counterparts. However, too few systems have been observed to confirm any definitive trends. Orion is the nearest star-forming complex with a sufficiently large pre-main-sequence population to enable a meaningful survey of these sources. We therefore propose a survey of all young >1.5Msolar G-, F-, A-, and B-type stars in Orion that are observable with JWST/MIRI. We will target these 45 disks with MIRI-MRS where at this distance they are not too bright to saturate the detector. Our legacy dataset will, for the first time, uncover the molecular content of these giant planet-forming disks which is much needed to interpret exoplanet atmospheric data and, complete a comprehensive library of disk spectra across the luminosity regime in Orion.

OBSERVING DESCRIPTION

We propose to observe 45 disks around young IMMTs and Herbig Ae/Be stars in Orion with JWST/MIRI-MRS. We use MIRI-MRS with complete wavelength coverage for all targets and set uniform exposure times across the sample such that a minimum S/N of 300 is reached in the line-rich 5-

JWST Proposal 10201 (Created: Monday, June 15, 2026, 9:00:17AM Eastern Standard Time) - Overview

25micron range of the spectrum. This setup will allow for the detection of key molecular and atomic lines at typical line-to-continuum ratios expected for disks. We will use a four-point dither strategy, the 'FASTR1' readout pattern and include the MIRI simultaneous imaging, with limited time and data cost, as this is the default observing mode. TA is included for all sources except the few that are too bright.

Proposal 10201 - Targets - Revealing the Chemical Reservoirs of Giant Planet Nurseries in Orion
