ABSTRACT

We propose JWST/MIRI F1140C coronagraphy to target GJ 832 b (~ 1 MJup, ~ 4 Gyr) in Cycle 5. This is our best, and last, chance to detect this cold Jupiter at its maximum apparent separation (~ 0.75). Leveraging decades of RVs plus Hipparcos/Gaia accelerations, we predict a dynamical mass of ~ 1.0 MJup and the planet's position to ~ 3 -5%, enabling matched-filter extraction at the known location. A 20 hr on-source plan (five RDI visits with a color-matched reference) achieves >5 sensitivity for ~ 125 K clear and cloudy models in F1140C. The measured mid-IR flux traces internal luminosity from long-term cooling, providing a stringent benchmark for evolutionary/atmospheric models at 100–200 K where few empirical anchors exist. Proximity (4.97 pc), mature age, and wide separation make GJ 832 b the clearest opportunity to calibrate these models and improve inferences for giants discovered by RV and transits that rely on them. A detection at this depth excludes broad swaths of high-opacity/cloudy solutions, sharpening constraints on the cooling history of Jupiter-mass planets while guiding future JWST/NIRCam or Roman/HWO follow-up.

OBSERVING DESCRIPTION

We will use a single filter, F1140C, for MIRI coronagraphy. Observations will be executed as five RDI visits, each consisting of alternating target and reference sequences to enhance PSF diversity and suppress speckles. The reference star, HD 203010, will be observed for an equal amount of time and is closely matched in brightness and color to GJ 832, minimizing chromatic residuals.

JWST Proposal 10758 (Created: Friday, March 13, 2026, 3:00:46PM Eastern Standard Time) - Overview

ETC simulations under low-background conditions predict $S/N > 5$ for both clear and cloudy 125 K models in just over 20 hours of integration. To provide margin for background variability, we will adopt 24 hours on-source, divided evenly across four RDI visits (~6 hr each). An equal amount of time will be spent on the reference star for optimal subtraction. We employ the 9-point small-grid dither pattern for the reference star to improve PSF sampling and mitigate detector artifacts.

This multi-visit strategy yields independent speckle realizations, enabling deeper combined contrast and robust background averaging. PanCAKE simulations confirm >5 sensitivity at the predicted 0.75 separation. The F1140C band, centered in the cloud-insensitive 11 μ m continuum, isolates intrinsic planetary emission and provides a clean, model-independent detection.

Proposal 10758 - Observation 21 - The Time Is Now: Last Chance to Snare the Mid-Infrared Glow of Jupiter's Real Twin

Special Requirements

Aperture PA Range 52 to 68 Degrees (V3 47.16455103 to 63.16455103)
No Parallel Attachments

Sequence Observations 13, 21, 22, Non-interruptible

Proposal 10758 - Observation 22 - The Time Is Now: Last Chance to Snare the Mid-Infrared Glow of Jupiter's Real Twin

Observation	Proposal 10758, Observation 22: HD203010 - 1140C												Fri Mar 13 20:00:46 GMT 2026
	Diagnostic Status: Warning												
	Observing Template: MIRI Coronagraphic Imaging												
	Background Observations:[GJ 832 - F1140 C - bg (Obs 13), HD203010 - 1140C (Obs 21)]												
Diagnostics	(Visit 22:1) Warning (Form): Overheads are provisional until the Visit Planner has been run.												
Fixed Targets	#	Name	Target Coordinates				Targ. Coord. Corrections			Miscellaneous
